

SUPPLEMENT TO CAREBRIDGE EXHIBIT

Service Description for Session Access Manager

Revised 11/1/2005 © McKesson Technologies Inc.

This Supplement will be strictly governed by the CareBridge Exhibit between McKesson and Customer.

1. **Service.** McKesson provides a firewall system that controls access by Customer's Business Partners to Customer's systems. Business Partner's Users ("*Users*") must authenticate to Session Access Manager ("*SAM*"), request connectivity to a specific Customer system, and then access Customer's system using User's standard access tools. Because SAM is a component of the CareBridge backbone network, both Customer and Business Partner must use a CareBridge Connectivity Service to access SAM.

Customer's Business Partner is responsible for administering userids for their users, according to Business Partner's policies and procedures. Customer defines and identifies their systems Users may access through SAM.

2. **Additional Responsibilities of McKesson.**

2.1 McKesson will configure and manage the CareBridge systems that provide Session Access Manager Service.

2.2 McKesson support will add and delete Customer system definitions in SAM upon customer request. There are no additional charges for these change requests.

2.3 By request, McKesson will provide a management report to Customer detailing the connections Business Partner's Users have made to Customer's systems through SAM. Reporting detail in SAM's database is kept for a minimum of one month. These reports are available at no additional charge.

3. **Additional Responsibilities of Customer.**

3.1 Customer will enable and maintain its network and systems to handle the communications protocols used by Business Partner to access Customer systems.

3.2 Customer will consult directly with Business Partner regarding Business Partner's security policies, procedures and controls, regarding their use of SAM and any other methods Business Partner uses to access Customer's systems.
